where 
$$y = Fri$$
.  
Next 3 weeks: Derivatives  
Today: derivatives of  $f(x) = sin(x)$ ,  $g(x) = cos(x)$ .

The instantaneous rate of change in y-coord, y =sin(a)

is different, depending what a is.

When a is close to 0, the derivative of sin(a) is big

When a is close to 90 degrees, the derivative of  $\sin(a)$  is small.

We'll see precisely why, next.

$$f'(x) = \lim_{h \to 0} \frac{\sin(x+h) - \sin(x)}{h}$$

$$= \lim_{h \to 0} \frac{\sin(x)\cos(h) + \sin(h)\cos(x) - \sin(x)}{h}$$

$$= \lim_{h \to 0} \frac{\sin(x)\cos(h) - \sin(x)}{h} + \sin(h)\cos(x)$$

$$= \lim_{h \to 0} \frac{\sin(x)(\cosh - 1)}{h} + \frac{\sin(h)\cos(x)}{h}$$

$$= \lim_{h \to 0} \frac{\sin(x)(\cosh - 1)}{h} + \frac{\sin(h)\cos(x)}{h}$$

$$= \lim_{h \to 0} \frac{\sin(x)(\cosh - 1)}{h} + \frac{\sin(h)\cos(x)}{h}$$

$$= \lim_{h \to 0} \frac{\sin(x)(\cosh - 1)}{h} + \lim_{h \to 0} \frac{\sinh(h)\cos(x)}{h}$$

$$= \lim_{h \to 0} \frac{\sin(x)(\cos(h) - 1)}{h} + \lim_{h \to 0} \frac{\sinh(h)\cos(x)}{h}$$

$$= \lim_{h \to 0} \frac{\sin(x)(\cos(h) - 1)}{h} + \lim_{h \to 0} \frac{\sinh(h)\cos(x)}{h}$$

$$= \lim_{h \to 0} \frac{\sin(x)(\cos(h) - 1)}{h} + \cos(x)[\lim_{h \to 0} \frac{\sin(h)}{h}]$$

$$= \frac{1}{1} \lim_{h \to 0} \frac{\cos(h) - 1}{h} + \cos(x)[\lim_{h \to 0} \frac{\sin(h)}{h}]$$

$$=$$
  $\otimes$  +  $\cos(x) \cdot 1 = \cos(x)$ 

Tools!  
defin: 
$$f'(x) = \lim_{h \to 0} \frac{f(x+h) - f(x)}{h}$$
  

$$\lim_{X \to 0} \frac{\sin x}{x} = 1$$

Explore is the derivative of 
$$f(x) = \sin(x)$$
 when  $x = 0$ ,  $x = \frac{\pi}{2}$ ,  $x = -\pi$   
what is the derivative of  $f(x) = \sin(x)$  when  $x = 0$ ,  $x = \frac{\pi}{2}$ ,  $x = -\pi$   
And  $f(x) = \sin x$   
 $f'(0) = \cos(0) = 1$   
 $f'(-\pi) = \cos(\pi/2) = 0$   
 $f'(-\pi) = \cos(-\pi) = -1$ 

Exercise: Reconcile these answers with:

https://www.desmos.com/calculator/yqwb4hqatl

By a similar calculation we find

$$\frac{d}{dx}(\cos x) = -\sin(x)$$

Exercise  

$$\int (x) = \frac{1}{x} + x^{2} + 3x + 5\cos x$$
use power rule

$$f'(x) = -\chi^{-2} + \partial \chi + \partial \chi = 5 sh \chi$$

Factor  

$$\frac{d}{dx} \left( f(x_1 \pm g(x_1)) = \frac{d}{dx} \left( f(x_1) + \frac{d}{dx} \left( g(x_1) \right) \right) \right)$$
corrected Not  $x \propto \div \underbrace{!!!!}{dx} \left( k f(x_1) \right) = k \underbrace{d}_{dx} \left( f(x_1) \right)$
