

75 AD → 1545

### Classical Mathematics After Archimedes:

- Syracuse fell to the Romans (212 BC)

- Carthage fell 146 BC

- Caesar conquered 40 BC

- Anthony & Cleopatra fell to Octavian in 30 BC

Roman Empire Begins

Ancient Romans were a practical engineering people who did not have a taste for pure mathematics.

- No great Roman Mathematician mentioned in Dunham.

### Library at Alexandria:

- Romans eventually control (30 BC) many of the scholars there were forced to evacuate. They did, to spread knowledge teaching.

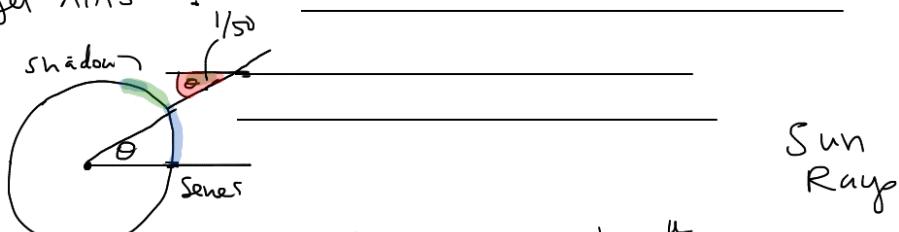

### Eratosthenes (284-192 BC)

- Machine

- Sieve for finding primes (Dunham)

- Accurate measure of circumference of the Earth.

B/C parallel, get AIA's =

- Angle  $\theta$  was estimated to be  $1/50^{\text{th}}$  that of a full revolution

- How far from Syene to Alexandria? 5000 "stades"

(stadium

$516.73' = 1 \text{ stade}$

$$\text{So: } \frac{5000}{\text{Circumference}} = \frac{1/50}{1}$$

$$\text{Circumf} = 5000 \times 50 = 250000 \text{ stades}$$

$$\approx 24,466 \text{ miles}$$

24,860  
actual

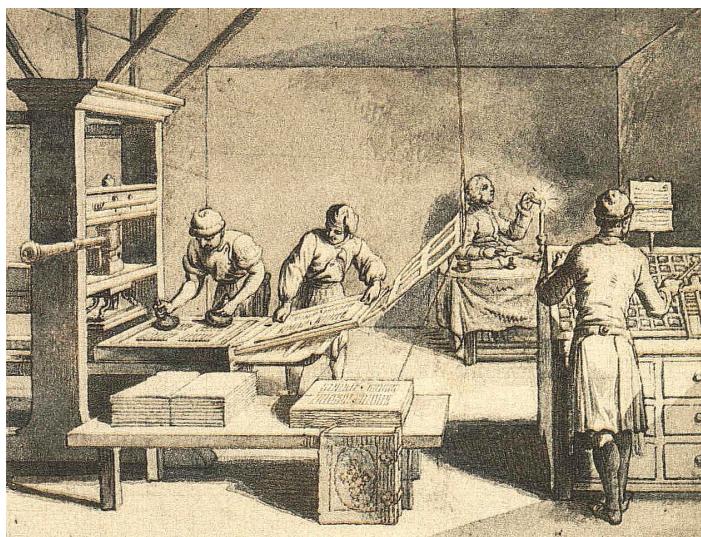

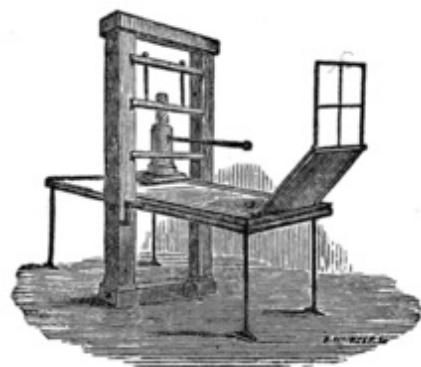

- During the Roman rule, mathematical progress was slow.
- classical works of Euclid, et tal were kept by the Arabians. (Baghdad)
  - the Muslim inhabitants studied these classics.
  - One bit of progress: Hindu-Arabic numeral system.  
BTW - The mathematics of India during this period 0 - 1000 CE was superior to European Mathematics
  - Al-Khowarizmi - Al'jbr. (although there was verbal descriptions of solving algebraic problems.)  
400 CE (beginning of algebra)
  - Crusades: Christian conquest of Middle East (11-13<sup>th</sup> Century)  
Christian conquest
  - Moors: \_\_\_\_\_ (Spain / Sicily)  
\_\_\_\_\_ found classical works.  
\_\_\_\_\_ this began the Renaissance.

[Medieval university](#) class (1350s)

1492

Luca Pacioli  
1494

### Luca Pacioli

- ▼ 1. Published *Divina Proportione*
  - On math / perspective / golden ratio
  - Da Vinci made the illustrations
- ▼ 2. Published *Summa de Arithmetica*
  - solve linear/quadratics
  - primitive symbolic algebra:  
 $co = cosa = \text{thing}$
- 3. Wrote: the general cubic equation is unsolvable

The first printed illustration of a rhombicuboctahedron, by Leonardo da Vinci, published in *Divina proportione*

$$ax^3 + bx^2 + cx + d = 0 \quad (\text{quadratic formula})$$

$$ax^3 + bx^2 + cx + d = 0$$

R similar?

$$\begin{aligned} x &= \sqrt[3]{\left(\frac{-b^3}{27a^3} + \frac{bc}{6a^2} - \frac{d}{2a}\right)} + \sqrt{\left(\frac{-b^3}{27a^3} + \frac{bc}{6a^2} - \frac{d}{2a}\right)^2 + \left(\frac{c}{3a} - \frac{b^2}{9a^2}\right)^3} \\ &+ \sqrt[3]{\left(\frac{-b^3}{27a^3} + \frac{bc}{6a^2} - \frac{d}{2a}\right)} - \sqrt{\left(\frac{-b^3}{27a^3} + \frac{bc}{6a^2} - \frac{d}{2a}\right)^2 + \left(\frac{c}{3a} - \frac{b^2}{9a^2}\right)^3} - \frac{b}{3a}. \end{aligned}$$

Leonardo da Vinci's failed attempt to solve  $x^3 = 2$

$$7x^3 + 5x = 5$$

### del Ferro

- ▼ 1. Father worked in paper industry
  - a. Possible b/c printing press
  - b. This likely gave del Ferro access
- ▼ 2. Depressed Cubic: Cube and cosa equals number
  - a. Solved it!
  - ▼ b. Didn't tell
    - i. Save the solution for challenges
- ▼ 3. Daughter married a mathematician
  - a. undoubtedly knew of Scipione's solution
- 4. On deathbed, told his student, Antonio Fior

Scipione del Ferro

Born: 1465

$$ax^3 + bx^2 + cx + d = 0$$

↓  
|  
| depressed  
↓

$$ax^3 + cx = d$$

## Antonio Fior

1. Student of del Ferro
- ▼ 2. Challenged Niccolo Fontana (b. 1500) to a duel
  - a. armed with ONLY the solution of the depressed cubic

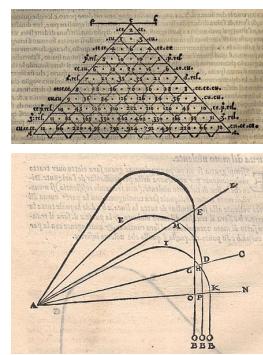

Twitter  
Antonio Fior (@FAntonio77) | Twitter

$$x^3 + mx = n$$

Niccolò Fontana Tartaglia: Italy 1500 - 1557

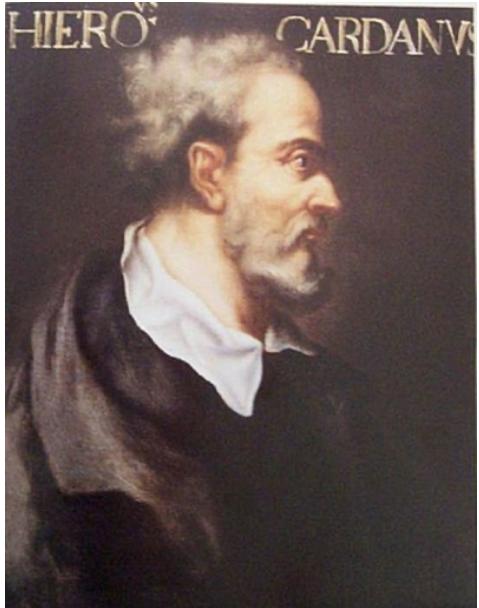

"Stammerer"

## Tartaglia

1. Powerful mathematician
2. 1st Italian translations of Euclid & Archimedes (1st correct Europena version of Elements)
3. Studied ballistics
4. Tartaglia eked out a living teaching practical mathematics in [abacus schools](#) and earned a penny where he could:

"This remarkable man was a self educated mathematics teacher who sold mathematical advice to gunners and architects, ten pennies one question, and had to litigate with his customers when they gave him a worn out cloak for his lectures on Euclid instead of the payment agreed on."

Begged Tartaglia for the solution

Pacioli: 1450

Scipione del Ferro: 1465

?

Antonio Fior: 1506

Solved depressed cubic  
— told no one (only Fior)  
(son in law was Mathematician)

Niccolò Fontana Tartaglia: Italy 1500 - 1557

1st Italian translation of Euclid and Archimedes

- also (independently) solved depressed cubic
- Didn't want to share, eventually did — in 9 Poems
- Forced Cardano not to share.

- wild man
- begged Tartaglia for depressed cubic sol'n.
- eventually has student  
↳ they travel to library where they find

### Del Ferris Sol'n

(son-in law)

- Felt he was 'off the hook' on sharing.
